WELCOME TO ZÜRICH!

Dear Colleagues and Friends,

It is with great pleasure that we welcome you to Zürich for the **30th anniversary edition of the European Society of Biomechanics Congress**. This milestone event not only celebrates three decades of advancing biomechanics in Europe and beyond, but also coincides with a remarkable local occasion—the **175th anniversary of ETH Zürich**, one of the world's leading institutions in science and engineering.

We are delighted to host **956 participants from 45 countries**, coming together to share research, exchange ideas, create new connections, and reconnect with old friends. Set in the heart of Switzerland's largest city, ESB 2025 promises a vibrant and forward-looking scientific programme. Under the theme "**AI in Biomechanics: Opportunities and Challenges**", this year's congress explores how artificial intelligence is shaping the future of our field. We are proud to present an outstanding line-up of keynote speakers, including **Molly Stevens, Scott Delp, and Mackenzie Mathis**, and to host a thought-provoking **debate session** on the future of physical modelling in biomechanics.

The programme features more than 80 scientific sessions, mentoring events, interactive poster sessions, and opportunities to connect with industry leaders in the **Advancements in Biomechanics** session. In addition, our **pre-courses** and **scientific awards** continue to support early-career researchers and celebrate outstanding achievements in the field.

Beyond the lecture halls, take the time to enjoy the beauty of Zürich—its lakeside charm, historic old town, and panoramic views from the ETH Polyterrace. Our social events, from the welcome reception to the congress dinner by the lake, are designed to create lasting memories and connections.

Thank you for being part of this special anniversary edition of the ESB Congress. We look forward to an inspiring week together!

Warm regards,

KEYNOTE TALKS

MOLLY STEVENS

Monday 7 July, 1:30pm – 2:15pm
Lecture: *Designing Biomaterials for Regenerative Medicine and Soft Robotics*

This talk will provide an overview of our recent developments in bioinspired materials for applications in regenerative medicine with focus on establishing translational pipelines to bring our innovations to the clinic. Our group has developed fabrication methods to engineer complex 3D architectures that mimic anisotropic and multiscale tissue structures and generate spatially arranged biostructurally biochemical cues. I will discuss recent advances in our tunable nanoneedle arrays for multiplexed intracellular biosensing at sub-cellular resolution and modulation of biological processes. We are developing creative solutions for targeted and controlled delivery using soft robotics and nanotherapeutics with unique bioinspired characteristics that respond to external stimuli to release a payload. Our design approach keeps state-of-the-art fabrication approaches while keeping in mind versatility and scalability to maximise the application potential. Finally, I will explore how these versatile technologies can be applied to transformative biomedical innovations and will discuss our efforts in establishing effective translational pipelines to drive our innovations to

clinical application while actively engaging in efforts towards the democratisation of healthcare.

SCOTT DELP

Tuesday 8 July 2025, 1:30pm – 2:15pm
Lecture: *Frontiers in Human Performance Research: Insights from Biomechanical Simulation and Machine Learning*

Rapid technical advancements in mobile sensing, computer vision, and data science have begun to enable planetary-scale experiments and major advancements in human health. In the next few years, these ongoing technical strides will culminate in a watershed moment for biomechanics and human performance research, when simulations run in real-time and AI becomes mainstream in studies of human movement and clinical applications. During my lecture, I will illustrate how our expanded capacity to amass large-scale datasets that characterize human movement, coupled with our accelerated ability to derive insights from automated data analyses, will inform clinical decisions and facilitate personalized training.

MACKENZIE MATHIS

Wednesday 9 July, 2:20pm – 3:05pm
Lecture: *Towards the Neural Basis of Adaptive Motor Control*

The neural activity of the brain is intimately coupled to the dynamics of the body. The motor system, which controls our outward behavior, spans multiple levels of hierarchical sensorimotor control: from the spinal cord, cerebellum, to the cortex and brainstem, at all levels, motor action is orchestrated. Yet we are experimentally limited to observing a small subset of all neurons of this hierarchy. Moreover, a mechanistic understanding of this complicated system is unknown, as mapping high-level behavior to neural activity is unconstrained. To address this, we built a large-scale model (MausSpaun) that captures hypothesized neural computations and coupled this with a novel model of the adult mouse forelimb in a physics simulation environment. We now use this model to better understand cortical computations during motor learning, which I will detail in my lecture.

Biography:

Prof. Mackenzie W. Mathis is the Bertarelli Foundation Chair of Integrative Neuroscience and an Assistant Professor at the Swiss Federal Institute of Technology, Lausanne (EPFL). Following the award of her PhD at Harvard University in 2017 with Prof. Naoshige Uchida, she was awarded the prestigious Rowland Fellowship at Harvard to start her independent laboratory at Harvard (2017-2020). She is an ELLIS Scholar, Vallee Scholar, a former NSF Graduate Fellow, and her work has been featured in the news at Bloomberg BusinessWeek, Nature, and The Atlantic. She was awarded the FENS EJM Young Investigator Prize 2022 & the Eric Kandel Young Neuroscientist Prize in 2023. Her lab works on mechanisms underlying adaptive behavior in intelligent systems. Specifically, the laboratory combines machine learning, computer vision, and experimental work in rodents with the combined goal of understanding the neural basis of adaptive motor control.

PRE-COURSES

Artificial Intelligence based shape representation

Date: 6 July 2025, 1:00pm – 3:00pm

Organizers: *Nazli Tümer, Morteza Homayounfar, Edwin Tay*

Deep learning (DL) tools are increasingly integral to medical image analysis, particularly for shape representation. With rapid advancements in methodologies and network architectures, these tools leverage datasets to deliver cutting-edge results across a range of tasks. In this workshop, we will introduce participants to the fundamentals of shape representation using DL-based techniques through a mix of lectures and hands-on exercise. Additionally, we will cover Git version control to ensure that the developed DL-based models are traceable, reproducible, and aligned with the principles of open science.

Automated model discovery: A Hands-on programming experience

Date: 6 July 2025, 1:00pm – 3:00pm

Organizers: *Ellen Kuhl, Mathias Peirlinck, Skyler St. Pierre, Moritz Flaschel*

This pre-course will cover a theoretical introduction, demos, and hands-on coding activities to automatically discover physics-based models from data. You should bring your own laptop and, if you like, your own data. We will provide benchmark data on brain, skin, arteries, and the heart, but are equally excited to help you analyse your own experiments. You will get the most out of this course if you familiarize yourself with the references and the code and prepare specific questions, but you are also welcome to attend if you are just curious about using artificial intelligence to explore biological systems.

Using the agent-based modelling software BioDynaMo for simulations in biomechanics

Date: 6 July 2025, 3:30pm – 5:30pm

Organizers: *Roman Bauer, Vasileios Vavourakis*

BioDynaMo is a versatile, open-source simulation platform designed for modeling complex biological systems (<https://www.biodynomo.org>). It offers a flexible framework for building and simulating agent-based models, enabling researchers to explore a wide range of biological phenomena. Here, we will give an introduction into BioDynaMo and explain how the principles of agent-based modelling are supported. To this end, we will present several use cases to showcase the software capabilities. Afterwards, the team will run a hands-on tutorial session where a simple simulation is conducted. The course will conclude with an interactive conversation to address FAQs and any questions raised by the audience.

The Hard in Soft – Image-based tissue mechanics from hard to soft tissues

Date: 6 July 2025, 3:30pm – 5:30pm

Organizers: *Marta Peña Fernández, Hari Arora, Uwe Wolfram*

Biological hard and soft tissues are architected or multiscale materials that hardly fulfil the definition of representative volume elements. Their behavior strongly depends on porosity that spans from nanometer to millimeter length scales as well as an anisotropic layout of their constituents. They are made of widely available materials, partly with inferior properties. Yet their composition and arrangement enable disparate material properties ranging from strengths of over 700 MPa to deformability of over 200%. Image-based tissue mechanics is an excellent tool-box to unlock such properties and study their dependence on aging and disease.

DeepLabCut For Measuring Animal Motion

Date: 6 July 2025, 3:30pm – 5:30pm

Organizer: *Mackenzie Mathis*

DeepLabCut is a deep learning-based python package for pose estimation that is open-source and free. It can be used on humans and other animals. It allows users to customize their models for specific keypoints (joints) of interest, or use a pretrained model. The workshop is tailored to new users of the software. It will include a short overview talk then hands-on practice with the code.
